

PRODUCT INFORMATION

J-FLEX INFLATABLE SEALS

J-Flex Inflatable Seals are designed to expand when inflated to form a tight barrier against a striking surface; thus effecting a positive seal against dust; moisture; contaminants and/or pressure differential.

No longer do you have to put up with loose tolerances associated with some extruded rubber sections! J-Flex Inflatable Seals are carefully extruded by technicians, who really do understand modern polymers & reinforcing materials. The unique processing technique results in seamless products of virtually limitless lengths and size, to your own particular specification.

Most importantly there are **no more** so called vulcanised joints that fall apart when **the pressure is really on!!**

Custom made using premium grade elastomers – Silicone; Fluorosilicone; EPDM & Neoprene etc., J-Flex Inflatable Seals are produced from precision extruded profiles thus ensuring maximum structural integrity which means - better resistance to rupture and tear and superior flex life.

Applications

- Watertight Door Seals & Food Processing Equipment
- Oven Door Seals
- Pollution Control and Laboratory Equipment
- Laundry, Textile and Paper Making Equipment
- Test Facilities In General Engineering
- Clean Room Door Seals
- Food and Pharmaceutical Process Areas
- Chemical Plants etc.
